

# Measurement of Water Appliance Noises in the Laboratory

according to DIN EN ISO 3822-1, 07.2009

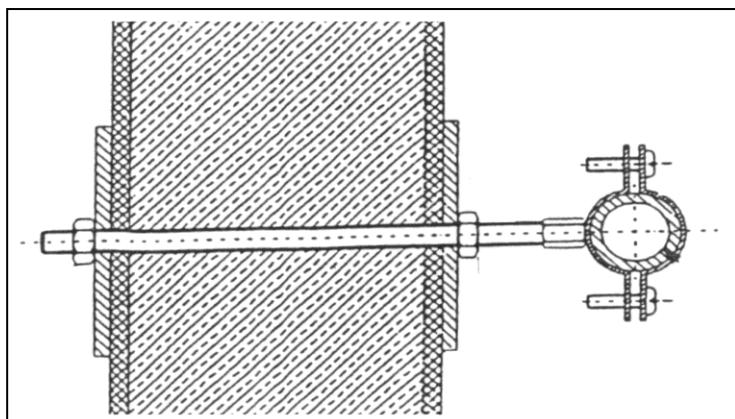

## Enclosure 8

Client: Pentair Engineered Electrical & Fastening Solutions, Jules Verneweg 75, 5015 BG Tilburg, The Netherlands  
 Test object: 1" steel pipe, outer dia d = 33,7 mm, fastened with Pipe clamp CADDY® MACROFIX PLUS (EPDM) (Article Number 400082), 32-35 mm, 1", M8/M10  
 Operation: Withdrawal with IGN according to DIN EN ISO 3822-1 at flow pressure of 0.3 Mpa (3 bar)

### Evaluation:

Measurement of the noise transmission at octave centre frequencies  $f = 125$  to  $4000$  Hz and calculation of the difference between "rigid" and "decoupled" fastening, Evaluation using the normative IGN-reference values, conversion to the average expected noise transmission in the building. **Measurement 2** on 30.09.2015, air temperature in test stand:  $20,1$  °C, relative humidity: 53,8 %

Schematic diagram for build-up of test object:

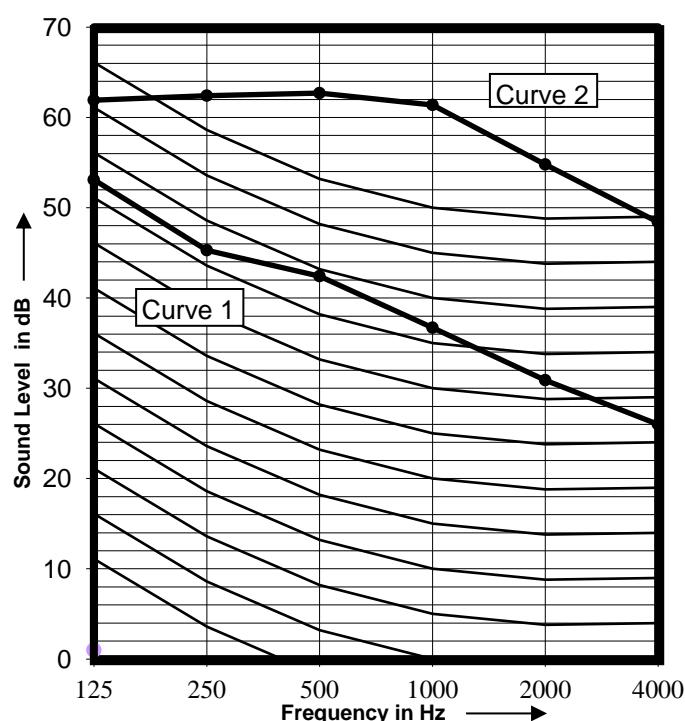

Test Criteria:

Volume test room:  $V = 74,3 \text{ m}^3$   
 Aver. reverb. time:  $\bar{T}_N = 1,38 \text{ s}$   
 Area measuring wall:  $F = 8,20 \text{ m}^2$   
 Area density:  $g_F = 232 \text{ kg/m}^2$   
 Length measuring pipe:  $L = 3,20 \text{ m}$   
 Outer diameter:  $D = 33,7 \text{ mm}$   
 Flow pressure:  $p = 0,30 \text{ MPa}$   
 Throughput:  $q = 0,13 \text{ l/s}$

Decoupling insert: **profiled rubber**

Measuring diagram:

Evaluation:

Curve 1: Noise transmission with fastening with pipe clamp type see above

$$L_{IN} = 23 \text{ dB(A)}$$

Curve 2: Noise transmission when using rigid fastening

$$L_{IN} = 45 \text{ dB(A)}$$

Improvement:

Frequency f [Hz]	125	250	500	1000	2000	4000
VM L <sub>IN</sub> [dB]	8,8	17,1	20,3	24,7	23,9	22,4

A-Evaluation

$$L_{IN} = 22 \text{ dB(A)}$$

No. of Test Report: 1583-001-15
